

Press release

RENAULT awards SAMES the robotic integration of paint solutions for its future “Zero Carbon” and “Zero industrial liquid reject” plant in Tanger (Morocco), for the coating of plastic parts.

The SAMES systems will achieve the finishing of the bumpers dedicated to 2 new vehicles of the DACIA range. Through this project, SAMES confirms its leading position as a robotic painting integrator, working in close cooperation with the major car markers.

The project will involve 4 painting robots, equipped with PPH 707 Hi-TE as well as a flaming robot. The impact on the environment of the Renault plant in Tanger will be reduced to a level never reached by a car making factory. In this frame, the final choice made by RENAULT for SAMES was in major part due to its PPH 707 Hi-TE high transfer efficiency solution: This feature secures the user to deposit a maximum paint onto the part to coat, thus to reduce the VOC* emissions.

The finishing quality provided by this sprayer as well as the productivity increase allowed, are also advantages which help improvement for SAMES' customers.

SAMES will achieve the robotic integration with MOTOMAN robots. Achievement of this project is scheduled on January 2012.

* *Volatile organic Compounds*

This medium-sized innovating industry based in Grenoble, the capital of the French Alps, confirms its position as a major robotic integrator on automaker's paint lines.
